

Two independent subject groups

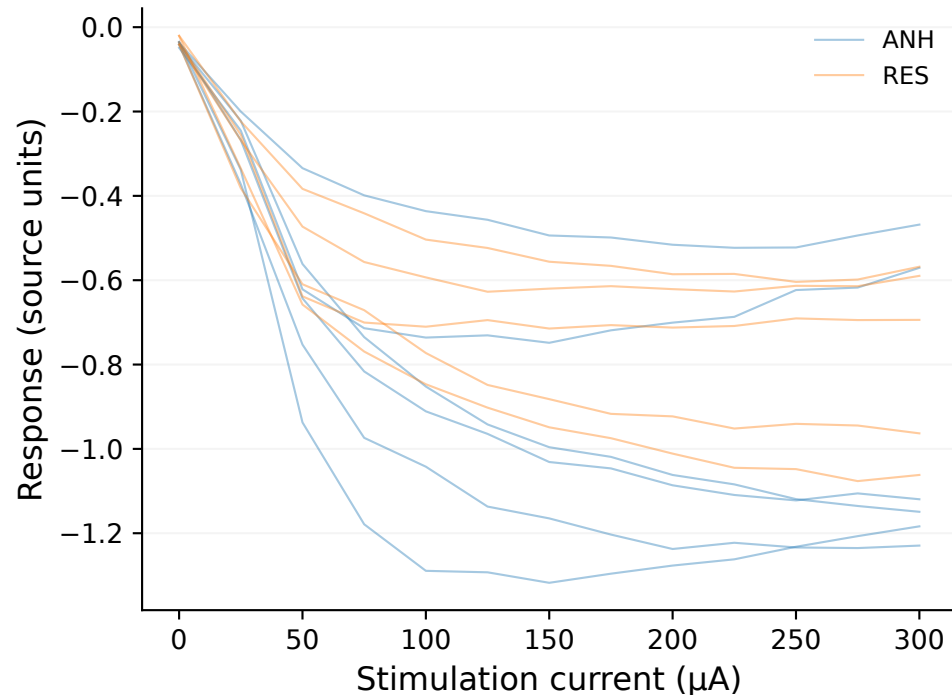

Source: stress_response_ca1.csv | ANH: n=6 | RES: n=5

Complete subject curves; finite-sample permutation inference conditional on exchangeability

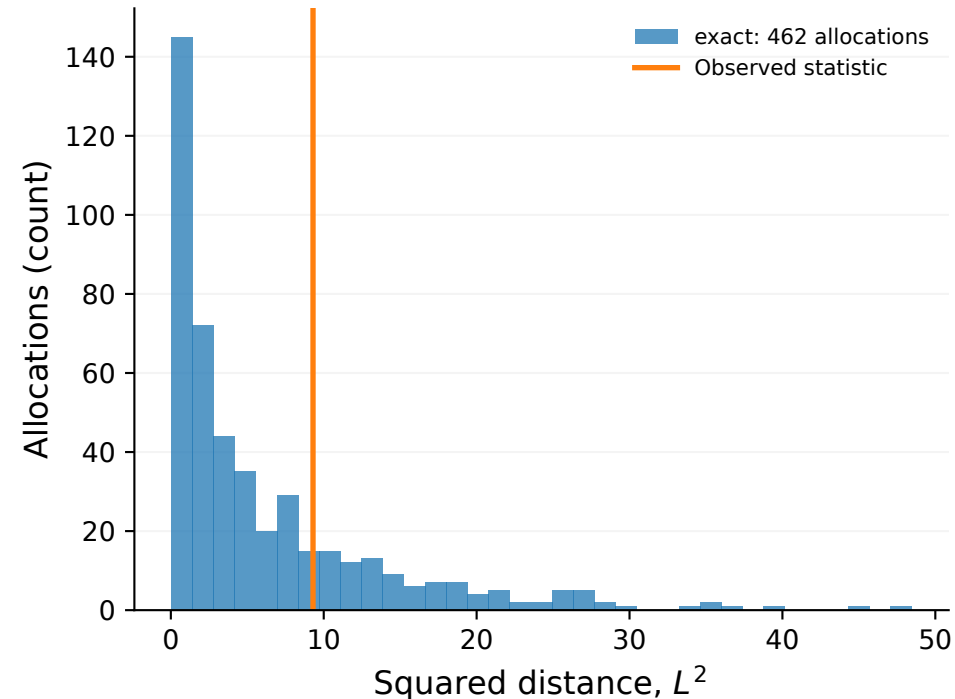

A Group means and SEM

B Individual subject curves

C Randomization distribution

Permutation $p = 0.2316$. Complete subjects are exchanged while retaining the two group sizes.

Small-count test runs check implementation; statistical conclusions require a suitable design and adequate precision.
