

Paired measurements from the same subjects

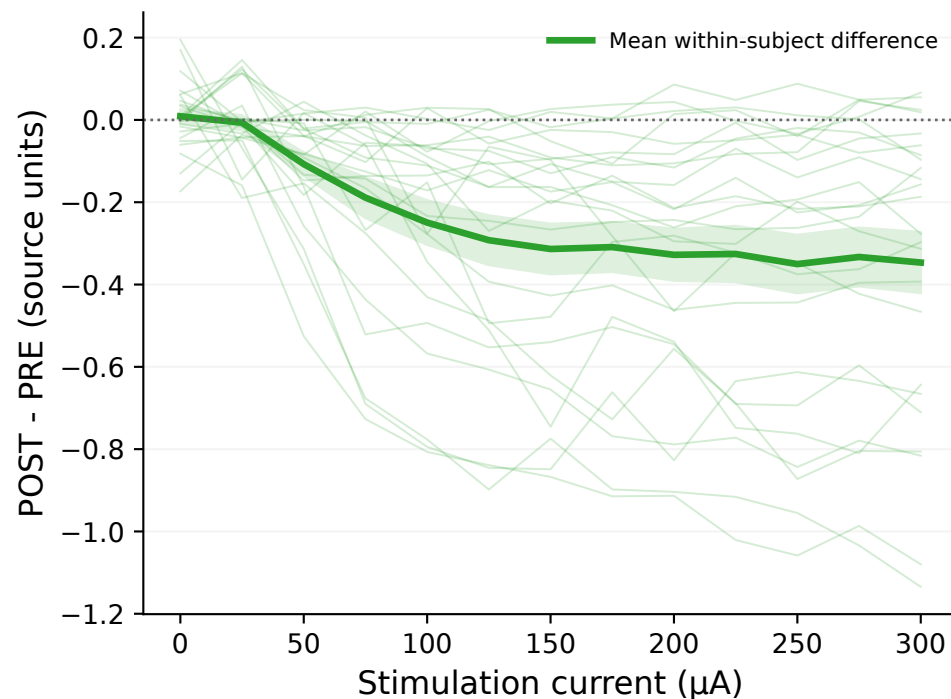

Source: ltp_paired.csv | PRE: n=24 | POST: n=24

Complete subject curves; finite-sample permutation inference conditional on exchangeability

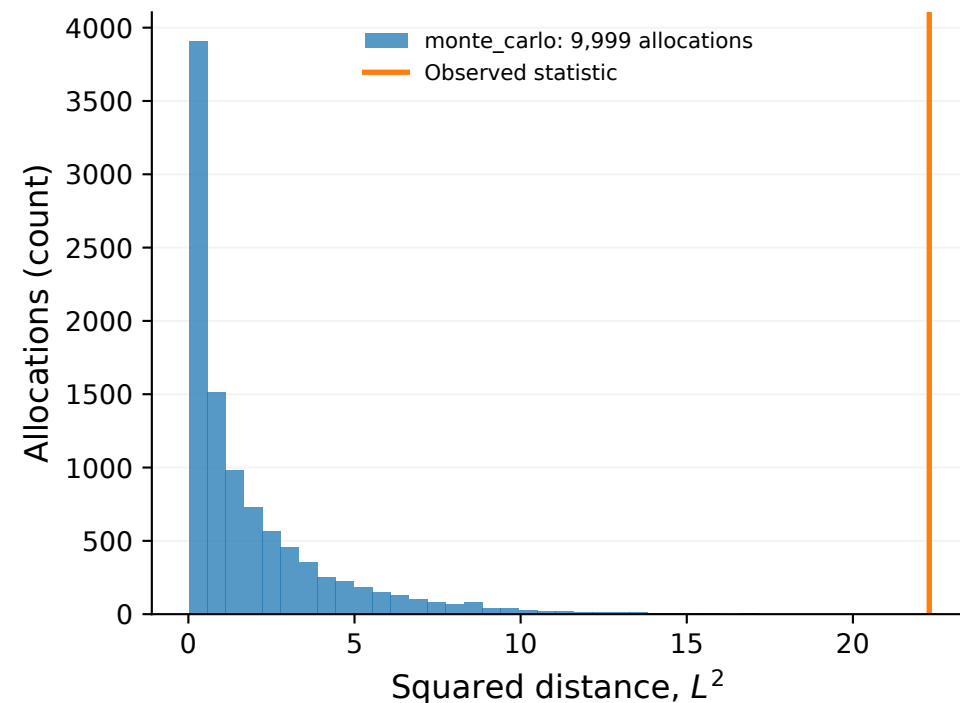

A Group means and SEM

B Matched subject differences

C Randomization distribution

Paired permutation $p = 0.0001$. Labels swap only within the same subject; stimulus points remain together.

Small-count test runs check implementation; statistical conclusions require a suitable design and adequate precision.
