

Three independent groups: omnibus and post-hoc inference

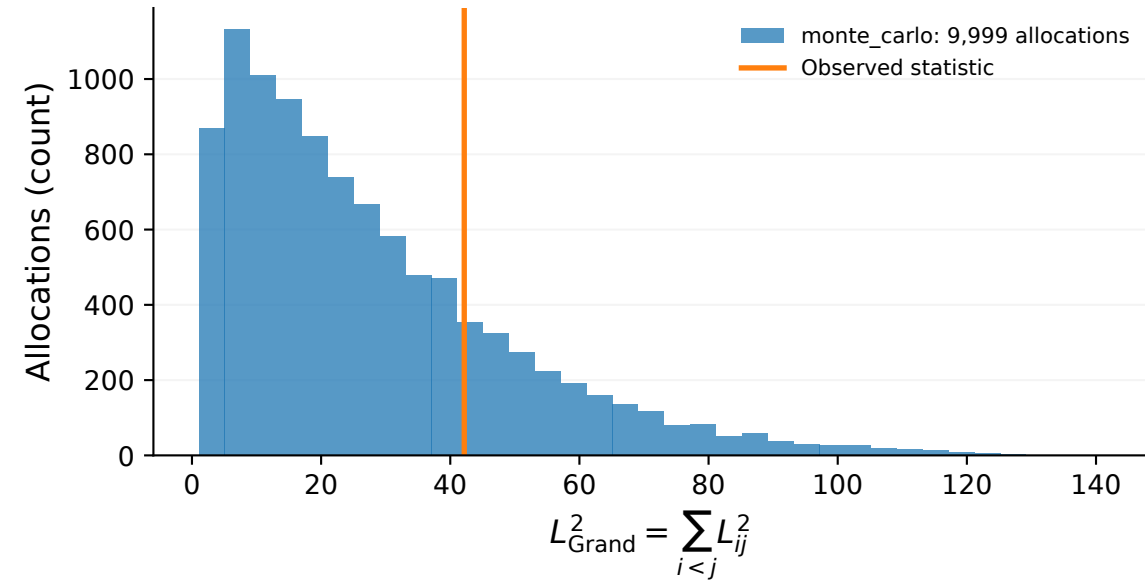

Source: stress_response_ca1.csv | CTR: n=6 | ANH: n=6 | RES: n=5

Complete subject curves; finite-sample permutation inference conditional on exchangeability

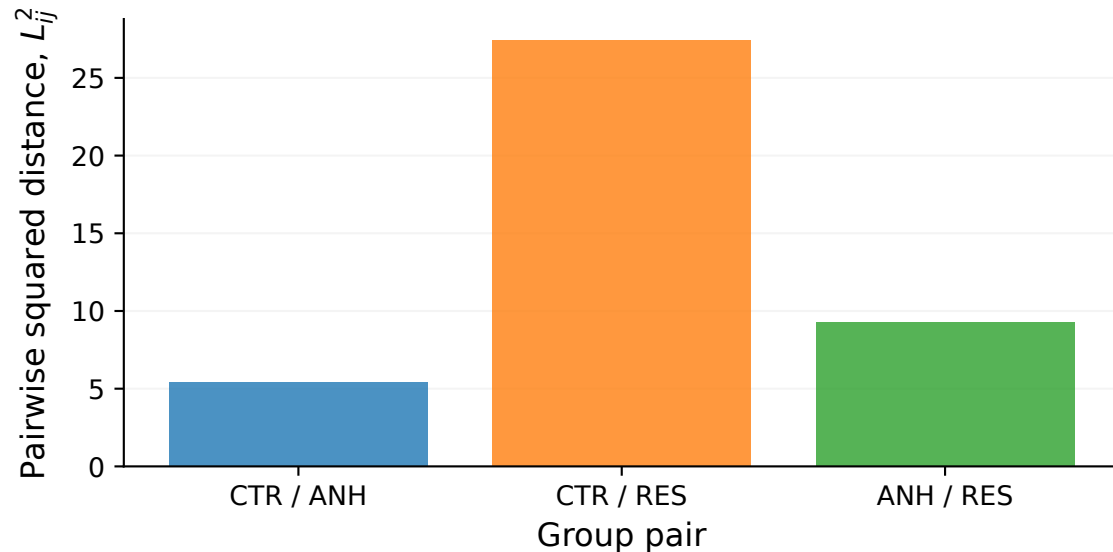

A Group means and SEM

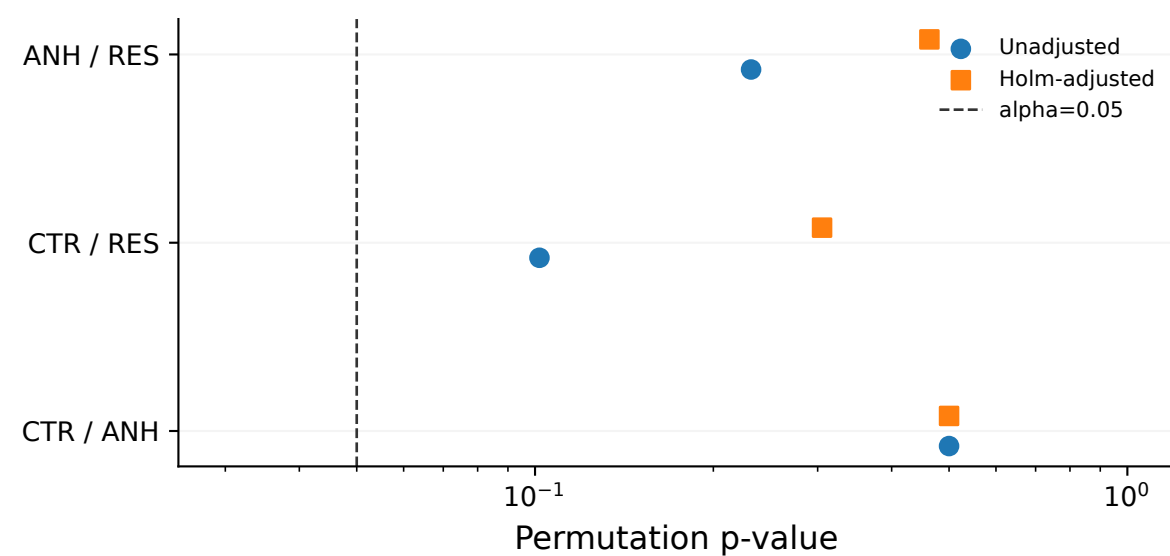

B Grand-distance null distribution

C Contributions to the grand distance

D Pairwise follow-up tests

Omnibus $p = 0.2159$. Holm correction covers all 3 pairs. Omnibus gate not passed: no gated pairwise rejection.

Small-count test runs check implementation; statistical conclusions require a suitable design and adequate precision.
