

Permutation inference and numerical precision

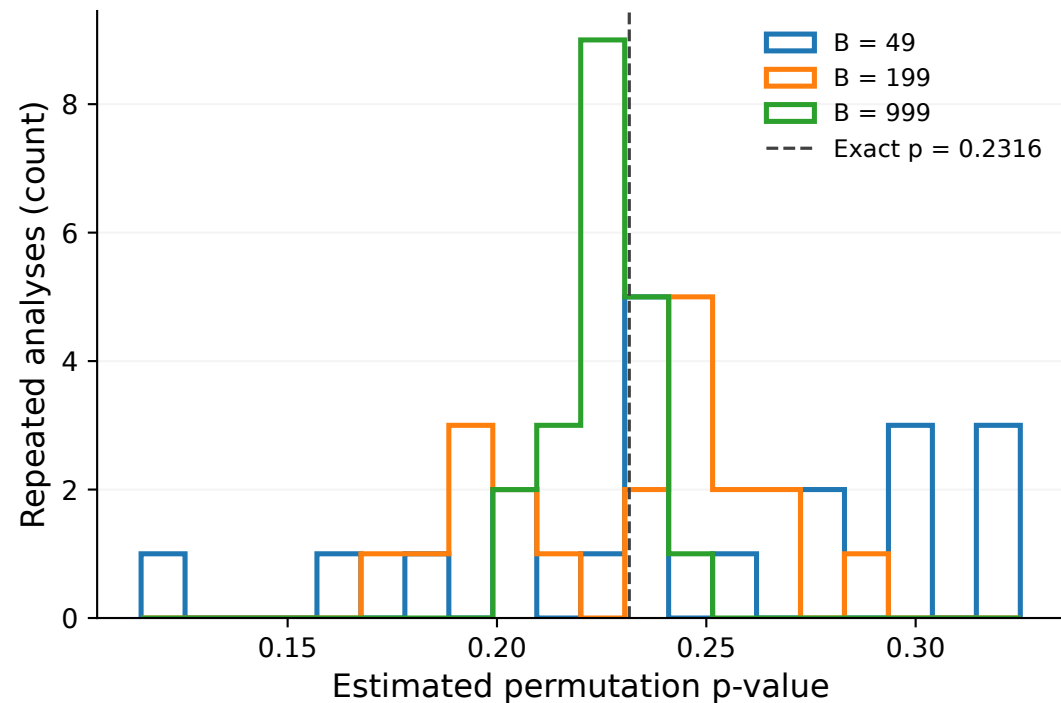

Original ANH vs RES grouping | $L^2 = 9.299$ | MC $p = 0.2320$

Exact reference: $p = 0.2316$ from 462 distinct allocations

A Randomization distribution

B Repeated p-value estimates

20 independent re-estimates per B on the same data. B is the number of random allocations, not the number of subjects.

Ties are included; Monte Carlo p-values use the +1 correction.
