

P-value distributions under the null and alternative

Null: R = 30 experiments | Alternative: R = 30 experiments | n = 6 | Monte Carlo: 199 allocations/test

TEST / LOW-PRECISION REGENERATION - not final validation

A Null experiments

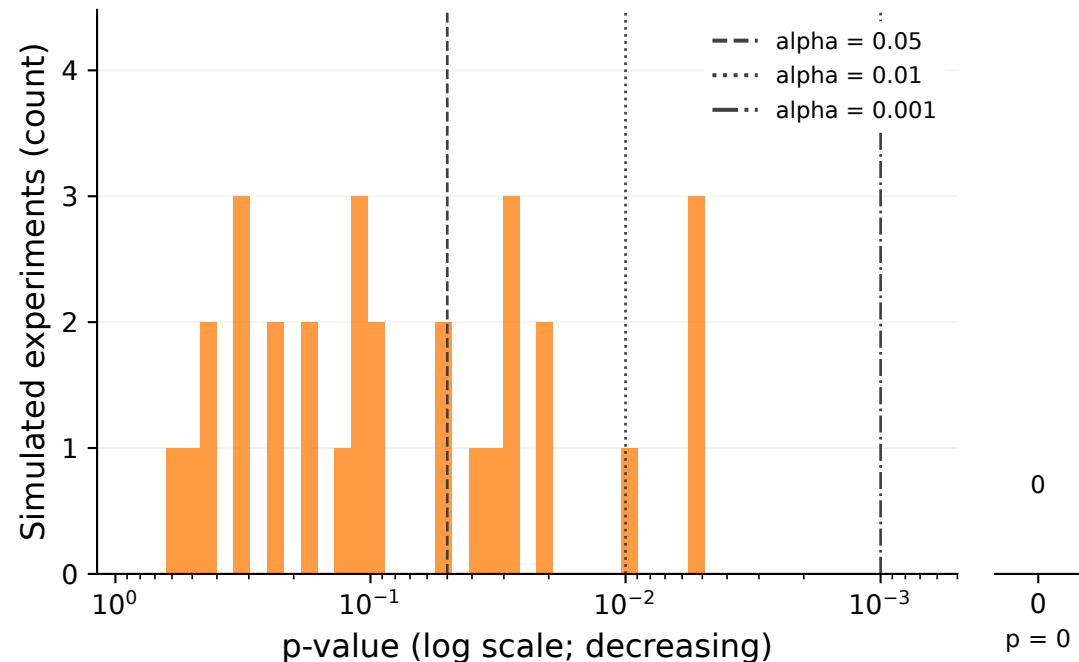

Zero
bin

False-positive fraction ($p \leq \alpha$)
0.05: 6.7% | 0.01: 0.0% | 0.001: 0.0%

B Alternative experiments

Zero
bin

Detection fraction ($p \leq \alpha$)
0.05: 36.7% | 0.01: 13.3% | 0.001: 0.0%

Zero values have a separate non-log bin and remain in all counts. No p-values are clipped or discarded.
Geometric-bin counts are not a uniform-density diagnostic. Performance is conditional on this simulation model.
