

Experimental and artificial input-output curves

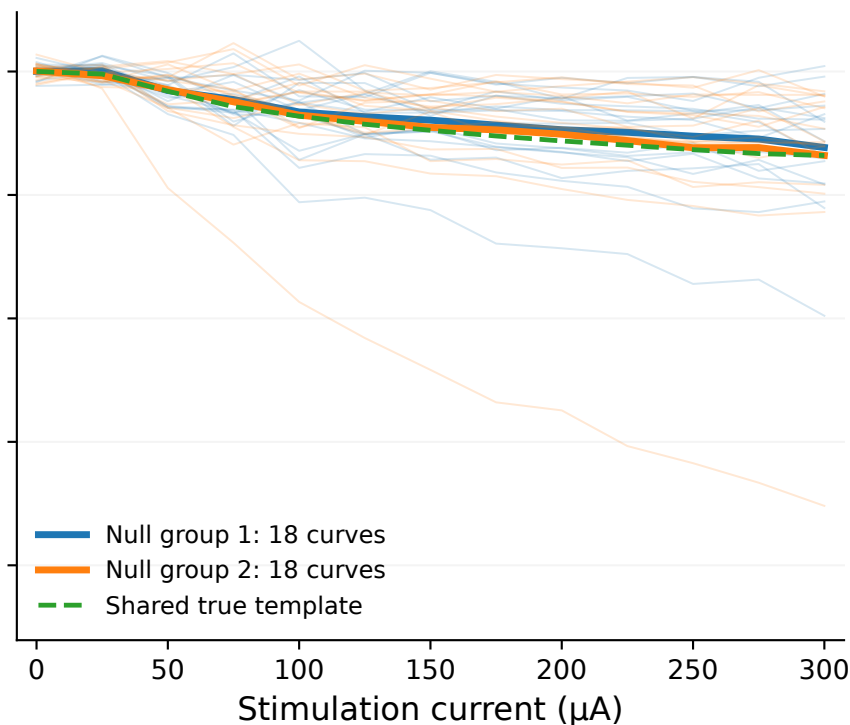

Source: ltp_paired.csv | examples: n = 6 subjects/group, m = 3 recordings/subject

Archive generator: shared gain/noise model; pooled null and separate PRE/POST templates

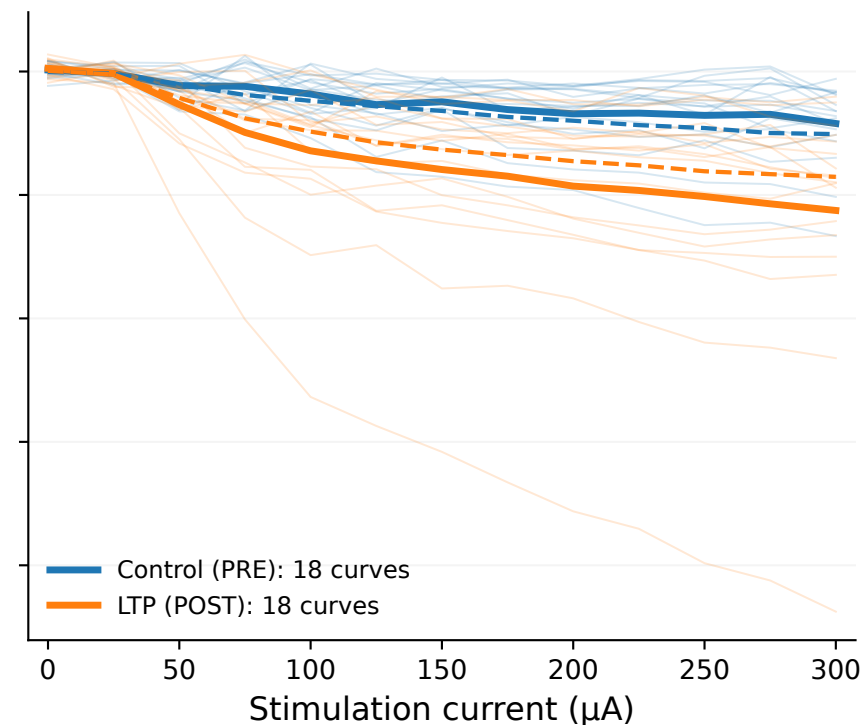

A Experimental recordings

B Null: same population

C Alternative: control vs LTP

Thin lines: individual recordings. Solid lines: sample means. Dashed lines: generating templates.
Statistical tests average the 3 recordings assigned to each artificial subject; the two null samples are independently generated.
