

Agreement between statistical methods

Prespecified $n = 10$ per group | $R = 30$ experiments in each panel | $\alpha = 0.05$

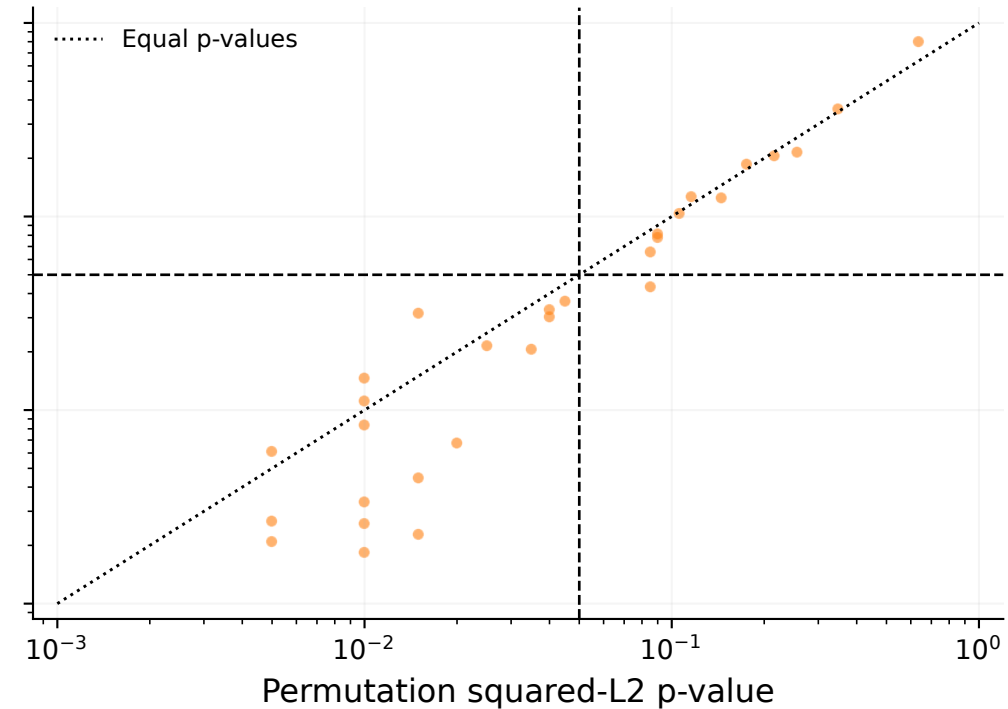

TEST / LOW-PRECISION RUN - layout and execution check only

A Null experiments

Both reject: 1/30 | L2 only: 0/30
ANOVA only: 0/30 | Neither: 29/30

B Control-LTP experiments

Both reject: 18/30 | L2 only: 0/30
ANOVA only: 1/30 | Neither: 11/30

Each point is one experiment analyzed by both methods. Dashed lines: significance threshold. No p-value jitter.
